

<p>f) the greatest lower bounds of b and c</p>	
<p>5. Classify each of the following as a total function, a partial function, or not a function.</p> <p>a) $f = \{(1, a)\}$ for domain space $\{1\}$ and range space $\{a, b\}$.</p> <p>b) $f(x) = 1/x$ when both domain and range space are the Real numbers (R).</p> <p>c) $f(x) = \sin(x)$ when domain space is the Natural numbers (N, the positive integers) and range space is R.</p> <p>d) $f(x) = x^{1/2}$ when both domain and range space are R. (Recall that the square root of a positive number n is $\sqrt[n]{n}$.)</p> <p>e) $f(x, y) = \max(x, y)$ for domain space $R \times R$ and range space R.</p> <p>f) $f = \{((1, 1), a), ((2, 1), b), ((1, 2), b)\}$ for domain space $\{1, 2\} \times \{1, 2\}$ and range space $\{a, b\}$.</p> <p>g) $f = \{((1, 1), a), ((1, 1), b), ((1, 2), b)\}$ for domain space $\{1\} \times \{1, 2\}$ and range space $\{a, b\}$.</p>	<p>a) This is a function. Because every element of domain matches with range. And also function is defined for all domain.</p> <p>b) This is a partial function. Because $f(x)$ does not have multiple values for a value of x. But also $f(x)$ is not defined for all values of x, since 0 is a real number but does not have any reciprocal.</p> <p>c) It is a partial function. Because for a value of x, function $f(x)$ does not have multiple values and it is not defined for all values of x.</p> <p>d) It is not a function. Because $f(x)$ has more than one value for a single value of x. For example $f(16) = +4$ and -4.</p> <p>e) It is a function because $f(x)$ is defined for all values of x and $f(x)$ does not have more than one value for the same value of x.</p> <p>f) It is a partial function because here not all domains are used like $\langle 2, 2 \rangle$ is not there and none used more than once.</p> <p>g) It is not a function because domain $\langle 1, 1 \rangle$ is used more than once.</p>
<p>6. Using the functions $f = \{(a, 1), (b, 2), (c, 2), (d, 3)\}$, $g = \{(1, z), (2, z), (3, x)\}$, and $h = \{(1, a), (2, b), (3, c)\}$, give the following. (Assume that the domain and range spaces are the values shown.)</p> <p>a) $f(b)$</p> <p>b) $g(f(d))$</p> <p>c) g restricted to the domain space $\{1, 2\}$</p>	

<p>d) $h \circ f$</p> <p>e) h^{-1}</p> <p>f) $h^{-1}(h(2))$</p>	
<p>7. Classify each of the following functions as: injection, surjection, bijection, or none. Give the most specific answer.</p> <p>a) $f = \{(a, 1), (b, 2), (c, 2), (d, 3)\}$ for domain space $\{a, b, c, d\}$ and range space $\{1, 2, 3, 4\}$</p> <p>b) $f = \{(a, 1), (b, 2), (d, 3), (c, 5)\}$ for domain space $\{a, b, c, d\}$ and range space $\{1, 2, 3, 4, 5\}$</p> <p>c) $f = \{(a, 1), (b, 2), (c, 4), (d, 3)\}$ for domain space $\{a, b, c, d\}$ and range space $\{1, 2, 3, 4\}$</p> <p>d) $f = \{(a, 1), (b, 2), (c, 4), (d, 3), (e, 1)\}$ for domain space $\{a, b, c, d, e\}$ and range space $\{1, 2, 3, 4\}$</p> <p>e) $f(x) = \cos(x)$ when both domain and range space are \mathbb{R}.</p> <p>f) $f(x) = 3x+2$ when both domain and range space are \mathbb{R}.</p> <p>g) $f(x) = x^2+1$ when both domain and range space are positive \mathbb{R}.</p>
